

Metal sunshades or louvered sunshades are different from canopies or metal awnings. Louvered Sunshades have become very popular over the last decade because of their sustainable heating and cooling benefits and aesthetic appearance. Louvered Sunshades are the best architectural product for sustainable heating and cooling of commercial buildings. The louvers in the sunshade will block the sunlight in the warmer months to provide shade to cool the space, and then in the cooler months, the louvers will allow sunlight in to heat the space. This is a great sustainable practice but also helps meet many new commercial construction building codes.

There are also fabric metal awnings that in the past have been extremely popular but due to their poor weathering because of the fabric, many commercial buildings are switching over to a more permanent solution that doesn't require as much maintenance and recovery.
