

### Blaze Control Fixed Sprinkler System Features List

Blaze Control Sprinkler Systems are constructed from copper pipe with brass fittings that provide durability, low maintenance, long service life and design flexibility to suit all building designs.

The volumes of water used, the system operating pressures and the correct sizing of pipework and the pump are all the subject of calculations to ensure the hydraulic performance of the system. This minimises the loads applied to the pump under the extreme conditions experienced during a bushfire and allows accurate determination of the run time for the system.

The system is custom designed to provide water coverage to "all" of the buildings' fire exposures

## Roof Sprinklers

Global

Water is sprayed on the roof of the building to lower the roof temperature, which in turn lowers the overall temperature of the building.
