

Here's How to Choose the Best Ceiling For Your Climate

Written by [Miles Long](#) on 18th Aug 2015

If you had to put a ceiling in that tropical bedroom in the picture, what would you choose? One of the things that I love about ceilings is that they offer diverse options that often depend on the climate you live in. A cathedral ceiling would be risky in a colder climate because it opens up the space and increases the heating bill. However, that same cathedral ceiling would be great for a moderate climate because it would allow the air to expand. The best ceiling for your situation often depends on the weather where you live.

Cathedral or Domed and High ceiling

Italy, Brazil

The Cathedral and Doomed ceiling are ideal for tropical climate because it would allow the hot air to rise cause its lighter than cool air and the cold air will flow through the house.
