Buildings supplying their required energy (heat and electricity) from microalgae (Figure 1) can serve as an alternative building system. The mechanism of the process is as follows: first, water containing nutrients is being filled in the facade PBRs, where daylight and CO2 are converted to algal biomass through photosynthesis; secondly, the biomass and heat generated by the facade element are transferred through a closed loop system to the plant room, where both forms of energy are exchanged by a separator and a heat exchanger, respectively. For the supply of hot water and heating the building, a hot water pump is used to adjust the temperature levels of the generated heat [62,63].

The Algae Roof

United Kingdom

The Algae Roof is a green roof system that uses algae to help cool buildings and produce biofuel.
